

Q12  
Cont

by supporting at least a portion of cup receiver 20 or base connector 22 when cup holder 18 is between the retracted and extended positions. When cup holder 18 is in the extended position, platform 90 supports base connector 22. Platform 90 and container 92 are illustratively shaped so that the outer surface contours of cup holder 18 appear to continue the contours of the outer surfaces of platform 90 and container 92. These shapes provide the appearance that the cup holder 18 is an integral part of the base 16 when the cup holder 18 is in the retracted position.

In the Claims

Please cancel claims 1, 3, 9-11 and 18. Add new claims 21-53 and amend claims 2, 12, 13, 14, 19 and 20 as follows:

1. (cancelled) A juvenile vehicle seat comprising  
a base and  
a cup holder,  
the cup holder having a retracted position adjacent the base and an extended  
position spaced from the base.

Q13 Sub  
B1

2. (Amended) The juvenile vehicle seat of claim 12, wherein the cup holder includes a connecting member, the connecting member being movable relative to the base, and a cup receiver coupled to the connecting member to move therewith.

3. (Cancelled) The juvenile vehicle seat of claim 1, wherein the cup holder is slidably mounted to the base.

4. (Unchanged) The juvenile vehicle seat of claim 2, wherein the base provides a receptor for the connecting member.

5. (Unchanged) The juvenile vehicle seat of claim 2 further comprising a detent carried on one of the base or the connecting member and a notch provided in the other of the base or the connecting member to inhibit movement of the cup holder from at least one of the retracted or extended positions.

6. (Unchanged) The juvenile vehicle seat of claim 2; wherein the connecting member includes a detent, the base includes a notch, and the detent engages the notch to inhibit movement of the cup holder from the extended position toward the retracted position.

7. (Unchanged) The juvenile vehicle seat of claim 6, wherein the base further includes an opening and the detent engages an edge of the opening to inhibit movement of the cup holder from the retracted position toward the extended position.

8. (Unchanged) The juvenile vehicle seat of claim 7, wherein the connecting member further includes a catch that engages the edge of the opening to inhibit removal of the cup holder from the base.

9. (Cancelled) A juvenile seat assembly comprising:

a juvenile vehicle seat, and

a cup holder movably secured to the juvenile vehicle seat, the cup holder being positionable between a first position and a second position,

wherein the cup holder is spaced apart from the juvenile vehicle seat by a first distance when the cup holder is in the first position and is spaced apart from the juvenile vehicle seat by a second distance when the cup holder is in the second position, the first distance being less than the second distance.

10. (Cancelled) The assembly of claim 9, wherein the cup holder includes a cylindrically-shaped cup retainer defined therein.

11. (Cancelled) The assembly of claim 9, wherein the cup holder is slidably secured to the juvenile seat.

12. (Amended) A juvenile vehicle seat assembly comprising

a seat, and

a cup holder movably secured to the seat, the cup holder being positionable between a first position and a second position,

wherein the cup holder is spaced apart from the seat by a first distance when the cup holder is in the first position and is spaced apart from the seat by a second distance when the cup holder is in the second position, the first distance being less than the second distance, and

wherein the assembly further comprises a base, the seat being removably secured to the base, and the cup holder is movably secured to the base.

13. (Amended) The assembly of claim 12, wherein the base is formed to include an aperture defined therein, and the cup holder includes a base connector, the base connector extending into the aperture.

14. (Amended) The assembly of claim 13, wherein the base connector includes a first portion and the base includes a second portion, the first portion cooperating

Q14 cont  
with the second portion to inhibit movement of the cup holder from at least one of the first or second positions.

10 15. (Unchanged) The assembly of claim 14<sup>9</sup>, wherein the first portion includes a detent and the second portion provides an engagement edge, the detent engaging the edge when the cup holder is in the first position to inhibit movement of the cup holder from the first position toward the second position.

11 16. (Unchanged) The assembly of claim 15<sup>10</sup>, wherein the first portion further includes a catch that engages the edge when the cup holder is in the second position to inhibit removal of the cup holder from the base.

12 17. (Unchanged) The assembly of claim 16<sup>10</sup>, wherein the second portion includes a notch and the detent engages the notch when the cup holder is in the second position to inhibit removal of the cup holder from the base and to inhibit movement of the cup holder from the second position toward the first position.

18. (Cancelled) A juvenile vehicle seat comprising  
a cup holder coupled to the seat and movable relative to the seat between a retracted position proximate the seat and an extended position spaced apart from the seat,  
the cup holder having a connecting member engaging the seat to inhibit movement of the cup holder from at least one of the retracted and extended positions.

Sub  
B3  
Q15  
19. (Amended) The juvenile vehicle seat of claim 12, wherein the base connector includes a retainer and the base includes a first retainer engaging portion and a second retainer engaging portion, wherein the retainer engages the first retainer engaging portion to inhibit movement of the cup holder from the extended position and the retainer engages the second retainer engaging portion to inhibit movement of the cup holder from the retracted position.

20. (Amended) The juvenile vehicle seat of claim 12, wherein the base connector includes a first retainer and a second retainer and the base includes a retainer engaging portion, wherein the first retainer engages the retainer engaging portion to inhibit movement of the cup holder from the retracted position and the second retainer engages the retainer engaging portion to inhibit movement of the cup holder from the base.

Q16  
1521. (New) A juvenile vehicle seat assembly comprising  
a seat,  
a base arranged to support the seat and formed to include a cupholder receptor  
and to include first, second, and third engagement surfaces, and

a cupholder mounted for movement relative to the base between a retracted position and an extended position, the cupholder including a cup receiver and a base connector coupled to the cup receiver and arranged to extend into the cupholder receptor formed in the base, the base connector including a first retainer arranged to confront the first and second engagement surfaces upon movement of the cupholder to the extended position to inhibit movement of the cupholder relative to the base and away from the extended position and arranged to confront the third engagement surface upon movement of the cupholder to the retracted position to inhibit movement of the cupholder relative to the base and toward the extended position.

<sup>16</sup>22. (New) The seat assembly of claim <sup>15</sup>21, wherein the first, second, and third engagement surfaces are arranged to lie in spaced-apart parallel relation to one another.

<sup>17</sup>23. (New) The seat assembly of claim <sup>16</sup>22, wherein the second engagement surface is positioned to lie between the first and third engagement surfaces.

<sup>18</sup>24. (New) The seat assembly of claim <sup>16</sup>22, wherein the first and second engagement surfaces cooperate to define an opening therebetween and a portion of the first retainer extends into the opening upon movement of the cupholder to the extended position.

<sup>19</sup>25. (New) The seat assembly of claim <sup>15</sup>21, wherein the base includes a deck formed to include the first, second, and third engagement surfaces and to define a ceiling of the cupholder receptor, the base connector includes a retainer mount portion that is arranged to lie under the deck and a neck portion that is arranged to interconnect the retainer mount portion and the cup receiver, and the first retainer is coupled to the retainer mount portion and arranged to extend upwardly toward the deck to confront the first and second engagement surfaces upon movement of the cupholder to the extended position and to confront the third engagement surface upon movement of the cupholder to the retracted position.

<sup>20</sup>26. (New) The seat assembly of claim <sup>19</sup>25, wherein the deck is formed to include a first opening defined in part by the first and second engagement surfaces and sized to receive therein a portion of the first retainer upon movement of the cupholder to the extended position and the deck is also formed to include a second opening defined in part by the third engagement surface and sized to receive therein a portion of the first retainer upon movement of the cupholder to the retracted position.

<sup>21</sup>27. (New) The seat assembly of claim <sup>20</sup>26, wherein the portion of the first retainer is a detent having a curved surface arranged to confront the first and second engagement surfaces upon movement of the cupholder to the extended position and to

confront the third engagement surface upon movement of the cupholder to the retracted position.

<sup>22</sup><sub>28</sub>. (New) The seat assembly of claim <sup>19</sup><sub>25</sub>, wherein the deck is formed to include a first opening defined in part by the first and second engagement surfaces and a second opening defined in part by the third engagement surface, the first retainer includes a flexible first tab cantilevered to the retainer mount portion of the base connector to move up and down relative to the deck and a detent appended to the flexible first tab to move up and down therewith, and the detent is sized to extend into the first opening to confront the first and second engagement surfaces upon movement of the cupholder to the extended position and to extend into the second opening to confront the third engagement surface upon movement of the cupholder to the retracted position.

<sup>23</sup><sub>29</sub>. (New) The seat assembly of claim <sup>22</sup><sub>28</sub>, wherein the detent has a curved surface arranged to contact the second engagement surface upon movement of the cupholder from the extended position toward the retracted position to urge the flexible first tab in a downward direction away from the deck to allow the detent to leave the first opening and upon further movement of the cupholder relative to the deck to reach the retracted position and wherein the flexible first tab provides means for moving the detent in an upward direction into the second opening to confront the third engagement surface upon movement of the cupholder to the retracted position.

<sup>24</sup><sub>30</sub>. (New) The seat assembly of claim <sup>19</sup><sub>25</sub>, wherein the base connector further includes a second retainer arranged to confront the third engagement surface upon movement of the cupholder to the extended position to inhibit further movement of the cupholder relative to the base away from the retracted position, the second retainer is coupled to the retainer mount portion to cause the first retainer to lie between the neck portion and the second retainer, and the second retainer is arranged to extend upwardly toward the deck to confront the third engagement surface upon movement of the cupholder to the extended position and to lie in spaced-apart relation to the third engagement surface upon movement of the cupholder to the retracted position.

<sup>25</sup><sub>31</sub>. (New) The seat assembly of claim <sup>19</sup><sub>25</sub>, wherein the base connector further includes a second retainer arranged to confront the third engagement surface upon movement of the cupholder to the extended position to inhibit further movement of the cupholder relative to the base away from the retracted position, the deck is formed to include an opening defined in part by the third engagement surface, and the second retainer includes a flexible tab cantilevered to the retainer mount portion of the base connector to move up and

down relative to the deck and a catch appended to the flexible tab to move up and down therewith and sized to extend into the opening to confront the third engagement surface upon movement of the cupholder to the extended position.

<sup>26</sup>  
~~32~~ (New) The seat assembly of claim <sup>25</sup>~~31~~, wherein the catch has a stop surface arranged to contact the third engagement surface to inhibit removal of the cupholder from the cupholder receptor formed in the base.

<sup>28</sup>  
~~33~~ (New) The seat assembly of claim <sup>25</sup>~~31~~, wherein the catch has a vertical stop surface arranged to contact the third engagement surface to inhibit removal of the cupholder from the cupholder receptor formed in the base and a sloped surface arranged to cam on the second engagement surface to bend the flexible tab downwardly to move the catch relative to the deck and away from the second engagement surface during initial insertion of the base connector into the cupholder receptor and movement of the cupholder relative to the base toward the retracted position.

<sup>27</sup>  
~~34~~ (New) The assembly seat of claim <sup>26</sup>~~32~~, wherein the catch is positioned to lie in the opening in spaced-apart relation to the third engagement surface upon movement of the cupholder to the retracted position, the first retainer includes a flexible tab cantilevered to the retainer mount portion of the base connector to move up and down relative to the deck and a detent appended to the flexible tab of the first retainer to move up and down therewith, and the detent is sized to extend into the opening formed in the deck to confront the third engagement surface and lie in the opening between the catch and the third engagement surface upon movement of the cupholder to the retracted position.

<sup>29</sup>  
~~35~~ (New) The seat assembly of claim <sup>15</sup>~~31~~, wherein the base connector further includes a second retainer arranged to confront the third engagement surface upon movement of the cupholder to the extended position to inhibit further movement of the cupholder relative to the base away from the retracted position.

<sup>30</sup>  
~~36~~ (New) The seat assembly of claim <sup>27</sup>~~34~~, wherein the first retainer includes a flexible first tab and a detent carried on the flexible first tab and the second retainer includes a flexible second tab and a catch carried on the flexible second tab.

<sup>31</sup>  
~~37~~ (New) The seat assembly of claim <sup>30</sup>~~36~~, wherein the detent has a curved surface arranged to contact the second engagement surface upon movement of the cupholder from the extended position toward the retracted position to urge the flexible first tab in a downward direction away from the second engagement surface to allow the detent to move under and past the second engagement surface upon further movement of the cupholder to reach the retracted position.

Q16

<sup>32</sup><sub>30</sub> (New) The seat assembly of claim <sup>30</sup><sub>30</sub>, wherein the catch has a vertical stop surface arranged to contact the third engagement surface to inhibit removal of the cupholder from the cupholder receptor formed in the base and a sloped surface arranged to cam on the second engagement surface to bend the flexible second tab downwardly to move the catch under and past the second engagement surface during initial insertion of the base connector into the cupholder receptor and movement of the cupholder relative to the base toward the retracted position.

<sup>33</sup><sub>30</sub> (New) A juvenile vehicle seat assembly comprising  
a base including a deck formed to include first and second openings, and a side wall formed to include a side opening, the deck and side wall cooperating to form a cupholder receptor located under the deck to receive a portion of a cupholder through the side opening formed in the side wall,

a seat supported on the base, and

Q16  
Cont.  
a cupholder arranged to extend into the cupholder receptor through the side opening formed in the side wall and move relative to the base between an extended position and a retracted position, the cupholder including a first retainer arranged to extend into the first opening formed in the deck to inhibit movement of the cupholder relative to the base upon movement of the cupholder to the extended position and to extend into the second opening formed in the deck to inhibit movement of the cupholder relative to the base upon movement of the cupholder to the retracted position, the cupholder further including a second retainer arranged to extend into the second opening formed in the deck to inhibit movement of the cupholder from the extended position to a withdrawn position outside of the cupholder receptor formed in the base upon movement of the cupholder to the extended position.

<sup>34</sup><sub>40</sub> (New) The seat assembly of claim <sup>33</sup><sub>30</sub>, wherein the base further includes a platform located under a portion of the cupholder, the side wall is located between the deck and the platform, and the cupholder is arranged to move along a path above the platform during movement of the cupholder between the retracted and extended positions.

<sup>35</sup><sub>41</sub> (New) The seat assembly of claim <sup>34</sup><sub>40</sub>, wherein the base further includes left and right guide supports located in the cupholder receptor under the deck and arranged to support a portion of the cupholder for sliding movement relative to the base during movement of the cupholder between the retracted and extended positions, the first and second retainers are coupled to said portion of the cupholder, and the platform is arranged to lie outside of the cupholder receptor formed in the base to support another portion of the

cupholder for sliding movement relative to the base during movement of the cupholder between the retracted and extended positions.

<sup>33</sup>  
~~39~~ 42. (New) The seat assembly of claim ~~39~~, wherein the base further includes left and right guide supports located in the cupholder receptor under the deck and arranged to support a portion of the cupholder for sliding movement relative to the base during movement of the cupholder between the retracted and extended positions.

<sup>37</sup>  
~~43~~ 43. (New) The seat assembly of claim ~~39~~, wherein the cupholder includes a cup receiver and a base connector coupled to the cup receiver and arranged to extend into the cupholder receptor formed in the base and the first and second retainers are coupled to the base connector.

<sup>38</sup>  
~~44~~ 44. (New) The seat assembly of claim ~~43~~, wherein the first retainer includes a flexible first tab cantilevered to the base connector and a detent carried on the flexible first tab and sized to extend into the first opening formed in the deck upon movement of the cupholder to the extended position to inhibit movement of the cupholder relative to the base and to extend into the second opening formed in the deck upon movement of the cupholder to the retracted position to inhibit movement of the cupholder from the retracted position to the extended position.

<sup>38</sup>  
~~45~~ 45. (New) The seat assembly of claim ~~44~~, wherein the second retainer includes a flexible second tab cantilevered to the base connector and a catch carried on the flexible second tab and sized to extend into the second opening formed in the deck upon movement of the cupholder to the extended position to inhibit withdrawal of the base connector from the cupholder receptor formed in the base through the side opening formed in the side wall.

<sup>40</sup>  
~~46~~ 46. (New) The seat assembly of claim ~~45~~, wherein the second retainer includes a flexible second tab cantilevered to the base connector and a catch carried on the flexible second tab and sized to extend into the second opening formed in the deck upon movement of the cupholder to the extended position to inhibit withdrawal of the base connector from the cupholder receptor formed in the base through the side opening formed in the side wall.

<sup>41</sup>  
~~47~~ 47. (New) A juvenile vehicle seat assembly comprising  
a base formed to include a cupholder receptor,  
a seat supported on the base to lie above the cupholder receptor, and  
a cupholder mounted for movement in the cupholder receptor formed in the base between a retracted position and an extended position, the cupholder including a base

connector arranged to extend into and move in the cupholder receptor formed in the base, a cup receiver adapted to receive a cup therein and located to position a portion of the cup receiver under the seat upon movement of the cupholder to the retracted position and to position the cup receiver away from the seat upon movement of the cupholder to the extended position, and retainer means coupled to the base connector for contacting the base to inhibit movement of the cupholder relative to the base between the retracted position and the extended position.

42  
48. (New) The seat assembly of claim 41, wherein the base includes a deck, and a side wall formed to include a side opening and cooperate with the deck to form the cupholder receptor under the deck to receive the base connector through the side opening formed in the side wall.

43  
49. (New) The seat assembly of claim 48, wherein the base includes a platform positioned relative to the deck to locate the side wall therebetween and positioned to underlie a portion of the cup receiver upon movement of the cupholder to each of the retracted and extended positions.

44  
50. (New) The seat assembly of claim 49, wherein the base further includes a container coupled to each of the side wall and the platform.

45  
51. (New) The seat assembly of claim 49, wherein the base further includes a guide support located in the cupholder receptor under the deck and arranged to support the base connector for sliding movement relative to the base during movement of the cupholder between the retracted and extended positions and movement of the cup receiver on the platform.

46  
52. (New) The seat assembly of claim 41, wherein the deck is formed to include first and second openings located under the seat and the retainer means includes a first retainer coupled to the base connector and arranged to extend into the first opening formed in the deck to inhibit movement of the cupholder relative to the base upon movement of the cupholder to the extended position and to extend into the second opening formed in the deck to inhibit movement of the cupholder toward the extended position upon movement of the cupholder to the retracted position.

47  
53. (New) The seat assembly of claim 52, wherein the retainer means further includes a second retainer coupled to the base connector and arranged to extend into the second opening formed in the deck to inhibit movement of the cupholder from the extended position to a withdrawn position outside of the cupholder receptor formed in the base upon movement of the cupholder to the extended position.
